#### SILENCER DB/851

#### Aperflux 851

With decibel noise limitations and problems becoming an increasing safety concern, the DB silencer option is a unique feature that reduces regulator noise. When the DB silencer is used, it allows you to considerably reduce the noise level (dBa) up to 30 dBa, depending upon the application. The Aperflux 851 pressure regulator can be supplied with an incorporated silencer in either the standard version or version with incorporated slam-shut or incorporated monitor regulator. With the built-in silencer, the Cg and KG valve coefficients are 5% lower than the corresponding version without the silencer. With this modular feature of the regulator, the silencer may be retrofitted to both standard Aperflux 851 version as well as those with incorporated slam-shut or monitor, without any need for piping modification. Pressure reduction and control operate in the same manner as the standard version.

The Aperflux 851 pressure regulator offers the possibility of installing an incorporated slam shut valve SB/82 or HB/97 valve, depending on the regulator size. This can be done either during the manufacturing process or be retrofitted in the field. Retrofitting can be done without modifying the pressure regulator assembly.

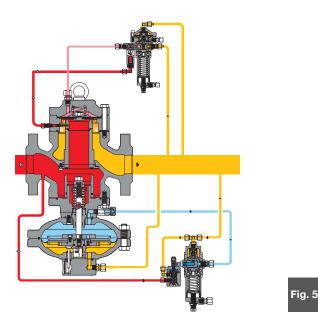

The Cg and KG coefficients of a regulator plus an incorporated slam-shut system are 5% lower than those for standard versions.

The main characteristics of the slam shut are:

- intervention for over pressure and/or under pressure
- manual re-setting with internal bypass activated by the lever mechanism;
- manual push button control;
- compact dimensions;
- easy maintenance;
- optional pneumatic or electromagnetic remote control;
- optional installation remote signal devices (contact switches or proximity switches).

#### MONITOR PM/819

Aperflux 851

This emergency regulator (monitor) is directly mounted onto the body of the main regulator. Both pressure regulators, therefore, use the same valve body, although they have independent actuators, pilots and valve seats.

The operational characteristics of the PM/819 monitor are the same as for the Reflux 819 regulator (refer to specific catalog).

The Cg and KG coefficients of a regulator having an incorporated monitor are 5% lower than those for the standard version. Another great advantage offered by the incorporated monitor regulator is that it can be installed at any time, even on an existing regulator, without piping modification. This solution allows the construction of regulator stations with compact dimensions.

#### MAIN FEATURES

#### Aperflux 851

> Design pressure: up to 1450 PSIG (100 bar)

> Temperature:Pietro Fiorentini regulators are suitable for a minimum operating ambient temperature of – 31°F to 140 °F if the following conditions are met:

- Inlet flowing gas temperature shall be always higher than -4 °F;
- Inlet flowing gas shall filtered, clean and without any liquid impurities;
- > Range of inlet pressure bpe: 18.8 to 1230 PSIG (1.3 to 85 bar)
- > Range of outlet pressure Wh: 12 to 1073 PSIG (0.8 to 74 bar) depending on installed pilot
- > Minimum working differential pressure: 7,25 PSIG (0.5 bar) Recommended > 30 PSIG (2 bar) > Accuracy class AC: up to 1%
- > Closing pressure class SG: from 5% to 1,5% depending on outlet pressure
- > Available size DN: 1" -2" -3" -4" -6" -8" -10"
- > Flanging: class 150-300-600 RF or RTJ according to ANSI B16.5 and PN16 according to ISO 7005.

#### MATERIALS

# Aperflux 851

Body	Cast steel ASTM A352 LCC for classes 300 and 600 ASTM A216 WCB for classes 150 and PN16
Head covers	Rolled or forged carbon steel
Diaphgram	Vulcanized rubber
Valve seat	Stainless steel for DN $\leq$ 3" Carbon Steel with seal edge in stainless steel for size $\geq$ 4"
Seals	Nitril rubber
<b>Compression fittings</b>	According to DIN 2353 in zinc-plated carbon steel

The characteristics listed above are referred to as standard products. Special characteristics and materials for specific applications may be supplied upon request.

### Cg, KG and K1 coefficient

# Aperflux 851

K1 body shape factor	113.9	113.9	113.9	113.9	113.9	113.9	113.9	

\*Value with incorporated flow conditioner

For sizing formula refer to www.fiorentini.com/sizing

#### **CAUTION:**

The graph gives a quick reference of maximum recommended regulator capacity depending on selected size. Values are expressed in actual SCFH of Natural gas (s.g. 0,6): to have the data directly in SCFH it is necessary to multiply the value by the outlet pressure value in PSI – absolute.

#### PILOTS

#### Aperflux 851

Aperflux 851 regulators are equipped with series 300 pilot as listed below:

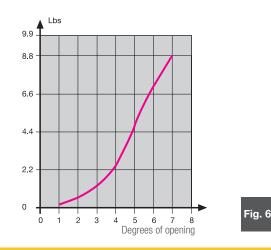

- 302/. control range Wh: 11.6 to 137.7 PSIG; (0.8 to 9.5 bar)
- 304/. control range Wh: 101.5 to 623.5 PSIG; (7 to 43 bar)
- 305/. control range Wh: 290 to 870.2 PSIG; (20 to 60 bar)
- 307/. control range Wh: 594.6 to 1073.3 PSIG; (41 to 74 bar)
- Pilots may be adjusted manually or remotely.

Pilot adjustments	Aperflux 851
Pilot type/A	Manual setting
Pilot type/D	Electric remote setting control
Pilot type/CS	Pneumatic remote setting control
F.I.O.	Smart unit for remote setting, monitoring flow limitation
	Smart and for formete botting, monitoring now infliction

The pilot system comes complete with an adjustable **AR100** restrictor. The flow rate of the pilot system is controlled by the bleed rate through the **AR100** restrictor.

The KG coefficients of the AR100 adjustable restrictor are shown for its various degrees of opening. KG formula used for calculating the flow rate of regulator can be applied for adjustable restrictor **AR100**.

It is necessary to consider that the pressure drop through the adjustable **AR100** restrictor should be about 2.9 PSIG (0.2) bar at the minimum opening flow of the regulator and about 14.5 PSIG (1 bar) at the maximum opening flow of regulator main diaphragm.

## **IN-LINE MONITOR**

Aperflux 851

The monitor is generally installed upstream of the main regulator. Although the function of the monitor regulator is different, the two regulators are virtually identical from the point of view of their mechanical components. The only difference is that the monitor is set at a higher pressure than the main regulator. The Cg and KG coefficients of the regulator plus in-line monitor system are about 20% lower than those of the regulator alone.
